

5130 occurrences with each 1 image, so 5130 images. 5130 unique floraveg\_id

2272 plots (unique GPS pair values) 1603 plots with NaN GPS values

/!\ Problem: in the conversion table, there are duplicate values of the key which is supposed to be the bridge between the 2 CSV. Therefore, it's not possible to perform a merge. - According to Marcela, it is normal that 1 syntaxon may be associated with more than one habitat. This will harden the task. Do we sample randomly ? take the first ? train duplicately ? Go for multilabel ? The key 'syntaxons' contains duplicate values:

```
In [53]: counts = df_labels['syntaxons'].value_counts()
...:
...: # Keep only duplicates (count > 1)
...: duplicates = counts[counts > 1]
```

```
In [54]: duplicates
Out[54]:
syntaxons
Scirpion maritimi          5
Alnion incanae             5
Carpinion betuli           5
Loto tenuis-Trifolion fragiferi  4
Fagion sylvaticae          4
..
Deschampsion argenteae     2
Arundion collinae          2
Inulo viscosae-Agropyron repentis  2
Bromo-Oryzopsion miliaceae  2
Hyperico perforati-Ferulion communis  2
Name: count, Length: 200, dtype: int64
```

$$F1 = \frac{2 \times TP}{2 \times TP + FP + FN}$$
